

R3B model output (within-model interval bounds; branches are counterfactual)

60 km/h, $\mu = 1.0$

100 km/h, $\mu = 1.0$

130 km/h, $\mu = 1.0$

60 km/h, $\mu = 0.5$

100 km/h, $\mu = 0.5$

130 km/h, $\mu = 0.5$

main-domain bounds (t_1 1.15–3.0 s)

upper extension with t_1 upper bound 4 s (supplement; sensitivity only)

..... TTC values of the scenario grid

Branches: P0 hold, P1 passive drag, P2 supported deceleration; -E authority at effective control, -U uncertain authority (f-t1).
